Title: Supporting hospital management with forecasting

Abstract:
The increasing strain on healthcare systems observed in recent years calls for efficient resource management. At the hospital level, short-term predictions of key variables (e.g., bed occupancy, waiting time in A&E department) can help policymakers implement adaptive strategies aimed at minimising risk for patients and maintaining system efficiency under pressure.
In this talk, I will go through a recent collaboration with data scientists at NHS that led to the implementation of an online tool providing daily updated bed occupancy forecasts for three hospitals in Bristol. Next, I'll discuss an ongoing collaboration with University Hospital Basel aiming at predicting sub-hospital data. Finally, I will conclude by outlining a follow-up project with Bristol NHS. multiscale cloud dynamics.
